Measure the Performance of SAP IBP Actions

One advantage of using custom VBA code is that several steps can be combined. Within one button, different simulation runs can be triggered, and data changes can be made and saved. This can be useful in different ways.

HOW TO START

In our example, we explain how you could set up an upgrade test to measure the performance of different actions in the SAP IBP, add-in for Microsoft Excel (Excel add-in). You can also use the test to make sure that those steps are still working after an upgrade of your SAP IBP system.

In the respective .xlsm file for this use case, you find one worksheet with the planning view for which we are running the tests, and a second worksheet including the upgrade test itself, where the performance measurements are collected. See the screenshot below.

Test Step Time Elapsed (sec) Refresh Simulate Run Forecast in Simulation Save	Run Upgrade Test			Reset Status		
Refresh Simulate Run Forecast in Simulation						
Simulate Run Forecast in Simulation	Т	est Step	Time Elapsed (sec)			
Run Forecast in Simulation	Refresh					
	Simulate					
Save	Run Forecast	in Simulation				
	Save					

The upgrade test we implemented in this example includes the following steps:

- 1. Refresh the planning view IBPAutomationObject.Refresh
- 2. Change a cell ActiveSheet.Range("K7").Value = 100
- 3. Run "Simulate Basic" Call IBPAutomationObject.Simulate
- 4. Run a statistical forecast operator in simulation mode Call IBPAutomationObject.Simulate ("My forecast model", "IBPFORECAST")
- 5. Save data Call IBPAutomationObject.SaveData (True)

You can suppress the dialog for reason codes, comments, and sharing, to not interrupt the performance measurements, by setting the parameter for suppressReasonCodeCommentDialog of the API SaveData to "True". For more information about SaveData, see SaveData on the SAP Help Portal.

To measure the performance of the different steps, the start and end time is collected, and the difference is added to the specific cells in the upgrade test worksheet as shown below.

StartTime = Timer IBPAutomationObject.Refresh SecondsElapsed = Timer - StartTime tester.Range("E8").Interior.ColorIndex = 35 tester.Range("E8").Value = SecondsElapsed

The whole code looks the following:

Private Sub RunUpgradeTest_Click()

Dim StartTime As Double
Dim SecondsElapsed As Double
Dim tester As Worksheet

ResetStatus_Click

On Error GoTo ErrorHandling:

If IBPAutomationObject Is Nothing Then Set IBPAutomationObject = Application.COMAddIns("IBPXLClient.Connect").Object Set tester = ActiveSheet

ActiveWorkbook.Sheets("Test 1").Activate 'refresh StartTime = Timer Call IBPAutomationObject.Refresh SecondsElapsed = Timer - StartTime

tester.Range("E8").Interior.ColorIndex = 35 tester.Range("E8").Value = SecondsElapsed

'change cell and simulate ActiveSheet.Range("K7").Value = 100 StartTime = Timer Call IBPAutomationObject.Simulate SecondsElapsed = Timer - StartTime tester.Range("E9").Interior.ColorIndex = 35 tester.Range("E9").Value = SecondsElapsed

'run simulation for forecast model xyz
StartTime = Timer
IBPAutomationObject.Simulate "001MoveAvrg2", "IBPFORECAST"
SecondsElapsed = Timer - StartTime
tester.Range("E10").Interior.ColorIndex = 35
tester.Range("E10").Value = SecondsElapsed

'save data StartTime = Timer Call IBPAutomationObject.SaveData(True) SecondsElapsed = Timer - StartTime tester.Range("E11").Interior.ColorIndex = 35 tester.Range("E11").Value = SecondsElapsed

'show the upgrade test worksheet tester. Activate

Exit Sub

ErrorHandling:

'Implement error handling to help the user to understand what went wrong MsgBox Err.Description, vbOKOnly, "Microsoft Excel: Custom VBA code"

End Sub

The ResetStatus_Click is just cleaning the last results:

Private Sub **ResetStatus_Click**()
Range("B8:E16").Interior.ColorIndex = 0
Range("E8:G16").Value = ""
End Sub

Feel free to adjust and include the steps that you want to test for your use case. You can run further operators in simulation mode or include further worksheets with planning views which need to be tested. Please keep in mind that the VBA code will have the same effect as clicking the respective buttons in the SAP IBP ribbon. If an error message comes up, the user interaction will be measured as well.

<u>Please note:</u> Code lines which already have been explained in the tutorial for other use cases are not explained in detail again, so please check those as well.
