# **Change Master Data Attribute Value**

With the newly provided API UpdateSingleMasterData it is possible to change the value of a specific master data attribute by using VBA code. If your business users must change one specific master data attribute several times per day you might include a specific logic in your template to make it possible to change the attribute value without the need of choosing *Manage* > *Single...* in the *Master Data* group in the *SAP IBP* ribbon.

We explain in our example how to implement changing the ABC code for a specific product ID by doubleclicking the cell of the ABC code in the planning view. The same code can be used for other attributes then ABC code as well, so as always feel free to adjust the code to your needs.

#### **HOW TO START**

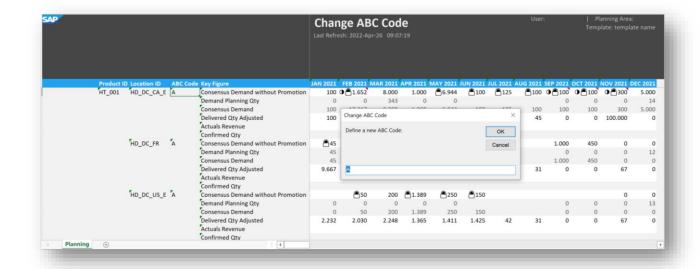

As a first step you need to create a planning view for which you want to include a specific logic to update master data attribute values. To use our sample code, the ABC Code needs to be selected as attribute, a part of others.

The trigger for the change of the ABC Code is a double-click on the cell of the ABC code of a specific product ID. To implement this we use the <a href="Worksheet\_BeforeDoubleClick">Worksheet\_BeforeDoubleClick</a> VBA event provided by Microsoft in combination with the SAP IBP APIs GetAttributeValues and UpdateSingleMasterData.

If a cell is double-clicked, we check whether the cell includes the ABC code. If yes, we determine the Product ID of the cell which was double-clicked with the API GetAttributeValues. Then we open an inputbox, to allow the user to enter a new value for ABC code.

Once the user confirmed the input by clicking ok, we are validating the input and calling the API UpdateSingleMasterData passing the master data type "Product", the Product ID and the new ABC code.

The code for this use case, is part of the worksheet "Planning" and looks the following:

Private IBPAutomationObject As Object

Private Sub Worksheet\_BeforeDoubleClick(ByVal Target As Range, Cancel As Boolean)

Dim ABCcode As String Dim attributes() As String Dim formula Dim newABC As Variant

On Error GoTo ErrorHandling:

If IBPAutomationObject Is Nothing Then Set IBPAutomationObject = Application.COMAddIns("IBPXLClient.Connect").Object

'Check if the cell includes the ABC code formula = Target.Formula2 If InStr(1, formula, "=@ EPMOlapMemberO(""[ABCID].[].[") = 0 Then Exit Sub

'Determine the Product ID

attributes = IBPAutomationObject.GetAttributeValues(Target.Offset(0, 4))

attributes = Filter(attributes, "[PRDID].[].")

If UBound(attributes) < 0 Then

MsgBox "The Product ID couldn't be determined.", vbOKOnly, "Microsoft Excel: Custom VBA code" Exit Sub

End If

End If

'Show a inputbox for entering a new ABC code

ABCcode = Target. Value2

newABC = InputBox("Define a new ABC Code:", "Change ABC Code", ABCcode)

'Check the input

If newABC = "A" Or newABC = "B" Or newABC = "C" Then

'Update ABCCode for the specific Product ID

ABCcode = "[ABCID].[].[" + newABC + "]"

Call IBPAutomationObject.UpdateSingleMasterData("Product", attributes, Array(ABCcode))

Call IBPAutomationObject.Refresh

Elself StrPtr(newABC) = 0 Then

Exit Sub

Else

MsgBox "The input you entered is not valid.", vbOKOnly, "Microsoft Excel: Custom VBA code" End If
Exit Sub

ErrorHandling:

'Implement an error handling to help the user to understand what went wrong MsgBox Err.Description, vbOKOnly, "Microsoft Excel: Custom VBA code"

End Sub

#### Code explained row by row:

<u>Please note:</u> Code lines which already have been explained in the tutorial for use cases provided with release 2202 are not explained in detail again, so please check those samples as well.

If IBPAutomationObject Is Nothing Then Set IBPAutomationObject = Application.COMAddIns("IBPXLClient.Connect").Object

If the SAP IBP automation object was not set yet, we retrieve it from the SAP IBP, add-in for Microsoft Excel (Excel add-in).

Check whether the formula of the Target cell which was double-clicked contains the ABC code, else exit the sub.

#### attributes = IBPAutomationObject.GetAttributeValues(Target.Offset(0, 4))

Determine the attribute values of the Target cell which was double-clicked.

As the range which is provided as parameter for GetAttributeValues needs to be part of the data area of the planning view, we need to shift the Target range by several columns (to the right). The exact number of shifted columns depends on the planning view that you have created (number of attributes and where the ABC code column is situated).

#### attributes = Filter(attributes, "[PRDID].[].")

Filter out the entry for Product ID from the array of attribute values, by using the <u>Filter function</u> (VBA function provided by Microsoft).

If UBound(attributes) < 0 Then

MsgBox "The Product ID couldn't be determined.", vbOKOnly, "Microsoft Excel: Custom VBA code" Exit Sub

End If

If the filtered array contains no entries, show the error message "The Product ID couldn't be determined." and exit the sub, else continue with the next steps.

### ABCcode = Target.Value2

Save the current value of the Target cell which was double-clicked as ABCcode using the Property  $\underline{\text{Value2}}$  provided by Microsoft.

```
newABC = InputBox("Define a new ABC Code:", "Change ABC Code", ABCcode)
```

Open an <u>inputbox</u> with prompt "Define a new ABC Code:", title "Change ABC Code" and default value ABCcode and save the entered value as newABC.

```
If newABC = "A" Or newABC = "B" Or newABC = "C" Then ...
Elself StrPtr(newABC) = 0 Then
```

Else

Exit Sub

MsgBox "The input you entered is not valid.", vbOKOnly, "Microsoft Excel: Custom VBA code"

Check the input. In our case only "A", "B" or "C" are allowed. If the user clicks "Cancel" (StrPtr(newABC) = 0) exit the sub, else the error message "The input you entered is not valid." shows up.

## **SAP Digital Supply Chain**

#### ABCcode = "[ABCID].[].[" + newABC + "]"

To pass the non-key attribute values that you want to change (parameter nonKeyValues of API UpdateSingeMasterData), the attribute values need to have the format [attribute ID].[].[attribute value] in this case for example [ABCID].[].[A].

#### Call IBPAutomationObject.UpdateSingleMasterData("Product", attributes, Array(ABCcode))

Call the API UpdateSingleMasterData, passing "Product" as masterDataType, the attributes array with the Product ID as keyValues and Array(ABCCode) as nonKeyValues.

Both parameters keyValues and nonKeyValues are from type String[], therefore you need to pass a one-dimensional string array, even if only one key attribute value or non-key attribute value is passed. Please make sure to only pass non-key attribute values that are different from the actual saved value, else an error message will be shown, see <a href="UpdateSingleMasterData">UpdateSingleMasterData</a> on the SAP Help Portal for further information.

#### Call IBPAutomationObject.Refresh

Call the API Refresh to refresh the active worksheet. With this the changed value will get visible for the user in the planning view.

#### Further comments to the code:

- Adjust the Offset of the Target cell to be used for GetAttributeValues according to your planning view.
- If you want to implement a generic logic that every attribute can be double-clicked and changed some
  more effort and VBA code is needed, similar applies as already described in sample "1.2 Show Master
  Data Details". To change master data attribute values via the API UpdateSingle-MasterData the ID or
  name of the master data type and the key attribute values are needed, please check the other tutorial for
  further information/ideas.
- The API UpdateSingleMasterData is not meant for mass changes of master data attributes. If you want to change a specific attribute value as shown in our example this is a good option.
